

Mt Orjen massif is a part of the mountain range of the coastal mountains of Montenegro, and certainly its most interesting section as well. It occupies the south-western part of Montenegro. In terms of the area, it is the largest mountain massif on the Adriatic coast. It is situated at the junction of three borders - of Montenegro, Croatia and Bosnia and Herzegovina. The main section of the massif comprises the groups of peaks situated in its central part which belongs to Montenegro. Mt Orjen is a constituent part of the system of the Dinarides, although it hasn't got the obvious spreading direction typical of the Dinarides. The highest peak of Mt Orjen, Zubački kabao, at the same time the highest peak of the coastal Dinarides, is 1894 metres high. More information on Mt Orjen, places to sleep, marked trails and speleo-objects you can find at www.subra.users.cg.yu

Two perhaps the best rocks in Montenegro - Subra and Reovačka greda are situated on this mountain.
