

Mt Bioč is the largest group of peaks which are positioned between the deep canyons- Sutjeska Canyon on the west and Piva Canyon on the east. The largest crags in the area of these three mountains are located in this massif.

Vrsta(The Sort) **Peak** is the predominant peak on the southern side of the Mratinje valley. It is characterized by an impressive north-east rock face, with the height of about 700m and the west rock face with the height of about 300m. North-east rock face with its exposed ridge forms, along with the west ridge of Oblik Peak, an amphitheatre of steep gulleys, and short rocky verticals extending to the north rock face of the barrier of Veliki Bioč and Gladište. In the rock face of Vrsta Peak there are two routes of 700 m, Istočni brid(The East Rim), IV and Centralni smjer(The Central Route), V, which were ascended 60-70 years ago but they still haven't got the first repeat!

The approach to the north-east rock face of Vrsta Peak goes from Mratinjsko Lake near the Mratinje village, through forest along the smaller lake to the screes below the rock.
