

Within these group of the mountains a special place is occupied by the rocky barrier of Mt Trnovački Durmitor which towers above the lake on its southern side. The north-west rock face of Trzivka Peak and the north rock face of Centralna glava Peak(Central Head) are the most prominent parts of this massif. In these rocks there are the most of ascended routes in this region in general- about 20. Almost all routes were ascended at the rock&alpine climbing camps in 1954 and 1956. All of them are up to IV grade of difficulty except Direktni smjer trapeza(The Direct Route of Trapezoid) - Grade VI.

Trzivka Peak is situated in the eastern part of the massif of Mt Trnovački Durmitor. The approach is from the marked trail Trnovačko Lake-Presjeka-Urdeni dolovi. The north-west rock face of Trzivka Peak is the highest crag in the massif of Mt Trnovački Durmitor. It has a height of about 350m. The approach to the rock is from Trnovačko Lake, along the herd path which turns left from the saddle, from the road to Trnovačke kolibe.

North Rock Face of Centralna glava Peak

Centralna glava Peak is, as its name says, the central peak in the massif of Mt Trnovacki Durmitor. Its northern section has several characteristic groups of crags. In the eastern part of the crag there is a prominent shape similar to the one of the trapesoid. It is connected with the north-west rock face with two obvious gulleys between which a rather large ridge sticks out. Central section of the rock face is the most prominent and the largest one. It has a height of about 250m. **Approach** to the rock is from Trnovačko Lake, along a herd path turning left from the saddle, from the road to Trnovačke kolibe - 1 hr.
