

Smokovac suburb is situated at the exit from the Morača Canyon, and it is around 5 kms away from the centre of Podgorica. It can be reached along the main road Podgorica-Kolašin. Crag in this area offer best opportunities for climbing shorter sport routes as well as the longer routes with the height of up to 120 m, both for its attractiveness and good quality, and for fast and easy approach. The rocks are of the limestone type, grey and yellowish in colour. Climbing season begins as early as at the end of the winter( February, March) and lasts till the late autumn( November, December), although one can climb throughout the year too, except on the coldest winter days and the hottest summer days. During the approach in the summer months one should pay attention to the snakes. Potentials for climbing and equipping the routes are not nearly enough exploited. There are several sectors(blocks). Important: crags in the area of Smokovac are located on private property, so we kindly ask climbers to behave politely and respect private property. Also, the rocks are open for further equipping but if you want to drill something at Smokovac it would be best to contact local climbers-the OCP.
